About

I'm an industrial designer from Tehran, completing my B.Sc. at Pars University of Art and Architecture (expected November 2026). I work across service design, UI/UX, brand identity, human-centred products and design for sustainability.

Background	Before industrial design I studied cinema. I have directed a short film and a stage play, and won the Best Costume Design Award at the Beyzaei Student Film Festival. That background shows up in my work as an interest in people, stories and the settings they happen in. I'm looking for master's study and design roles in service design, UX and product design.
Education	B.Sc. in Industrial Design, Pars University of Art and Architecture, Tehran 2021 to 2026 (expected) Diploma in Cinema, Sooreh Arts High School, Tehran 2021
Experience	Design and media intern, Rasta, Tehran. Edited and produced podcast episodes; designed release posters and social media visuals.
Honours	Ranked 225th nationally, National Arts Entrance Exam 2021 Best Costume Design Award, Beyzaei Student Film Festival Selected participant, Public Waste Bin Design Competition, University of Tehran
Skills	Product: SolidWorks modelling, assemblies, technical drawings and rendering; model making; wood and metal workshop; packaging mock-ups UX and graphics: Figma wireframes, interactive prototypes and design systems; WordPress Languages: English (advanced), Italian (A2)

Contents

Gym Box

Service design, UX. Private, fully equipped workout pods that people find, book and unlock with their phone.

3

Walkers for older adults

Inclusive product design, research. Walking aids for older adults with weak muscles and painful joints, for the short, risky trips around the home.

5

Be Natural

Packaging, brand. A carry-out box for a fresh-juice brand, with the bottles on top and a pull-out drawer for a side order.

7

Cut

Furniture design. A compact chair for film sets, shaped like a clapperboard, with a pocket for a tablet and headphones.

9

Convex / Concave

Product and accessory design. A sculptural shoulder bag, taken from a pencil silhouette to a full-scale felt prototype.

11

Service design, UX

Gym Box

A service for people stuck between a crowded gym and a cramped living room. Gym Box offers private, fully equipped pods that you find, book and unlock with your phone.

Type

Service design and UX

Team

Two designers

Context

Project 6, Service Design, Pars
University of Art and Architecture

Methods

Pain-point research, service journey,
service blueprint, app flow

The problem

At home there is no equipment and little space. Public gyms mean crowds, queues for machines, no privacy and fixed hours. Both end in lost motivation, and often in quitting.

What gets in the way

- **Operational:** waiting for machines, time lost travelling, no way to see how busy the gym is.
- **Psychological:** fear of judgement, distraction, privacy and hygiene worries, fear of doing exercises wrong.

The service and what runs behind it

1

Open the app

See the pods around you.

2

Check live availability

A real-time map shows which pods are free.

3

Book a session

45 or 60 minutes, in a few taps.

4

Unlock with your phone

A single-use QR code opens the door.

5

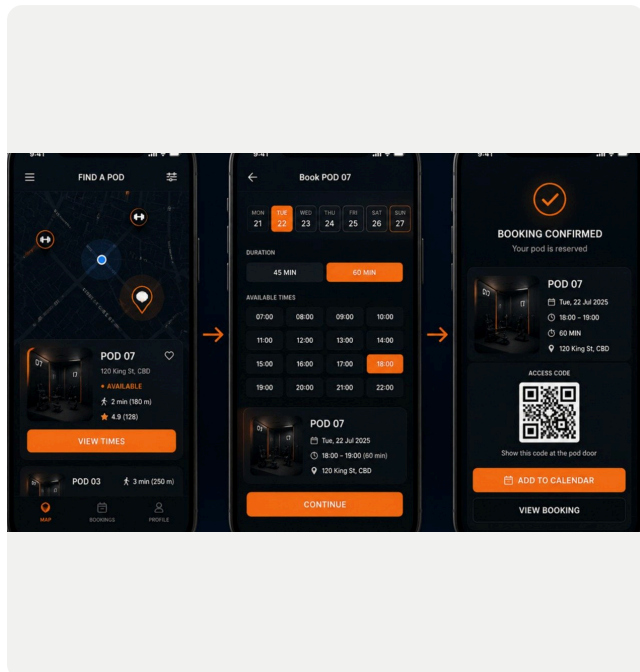

Train in private

Video guidance plays on the screen in the pod.

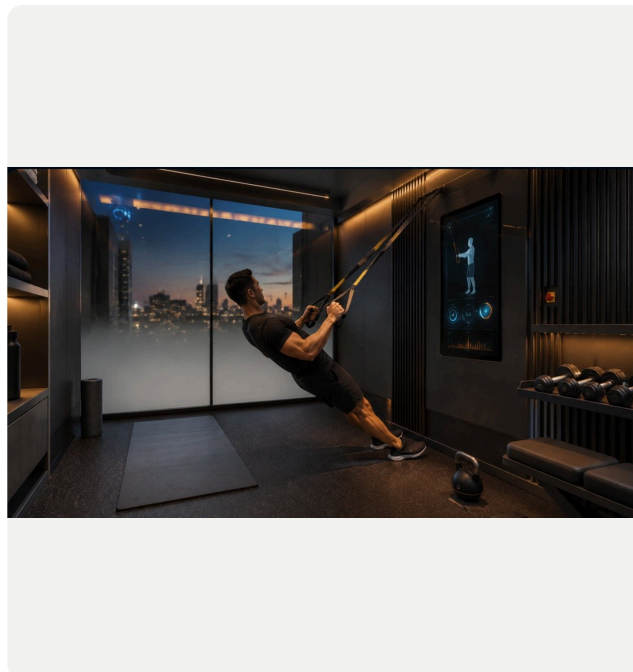

6

Leave

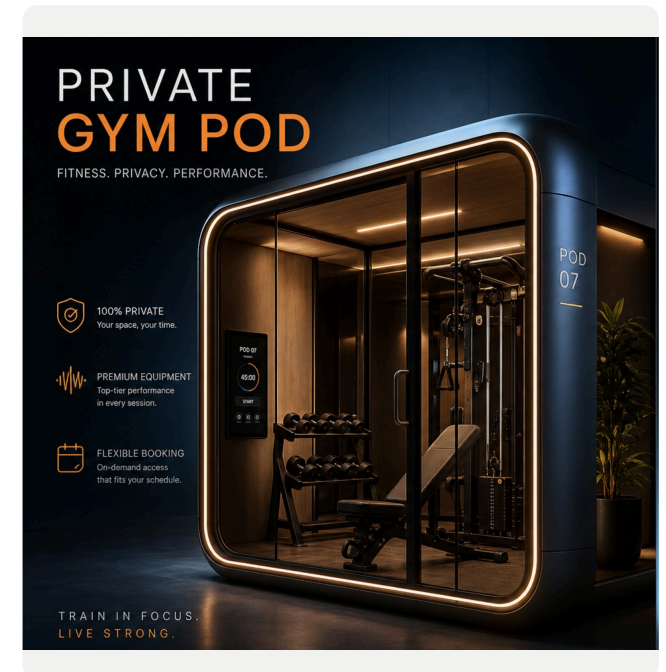

UV-C cleaning runs before the next booking.

App flow: find a pod, pick a time, get a door code.

Inside the pod: compact equipment and a training screen.

A single pod: acoustic shell, premium equipment.

Stage	User action	Touchpoint	Behind the scenes
Search and book	Checks availability and books a slot	Mobile app	Scheduling database and live capacity map
Access	Enters the pod with a code	Smart door	Code verification
Training	Chooses a video and trains	Screen in the pod	Video streaming from partner trainers
Exit	Finishes and leaves	Exit door	Automatic UV-C cleaning

Inclusive product design, research

Walkers for older adults

Mobility aids for older adults with weak muscles, painful knees or shoulders and poor balance, designed for short trips at home, such as bed to bathroom or front door to car.

Type	Team
Inclusive product design	Three designers
Users	Methods
Older adults with muscle weakness, joint pain and poor balance	Literature review, user needs, ergonomic data, sketching, rendering

The problem

About one in four older adults falls every year. Standard walkers are cheap and familiar, but wheeled models are less stable, curbs are hard to cross, and lifting the frame tires weak hands.

What users need

- Stability standing and moving; brakes that need little hand force
- A safe way over curbs, and a weight that can be lifted into a car
- A seat for resting and a safe way to stand back up
- Adjustable handles, around 48% of body height

Concepts, from sketch to render

A family of frames, each answering a different need. Every concept was drawn as a sketch first, then rendered.

Z-frame: one tube spreads weight across both hands and forearms.

Fold-down seat and a rechargeable light.

U-shaped frame with a small seat on soft wheels.

Three wheels, LED headlight, adjustable seat.

Multi-branch frame with pads and a seat.

Packaging, brand

Be Natural

New packaging for a fresh-juice brand. One box carries the bottles and, in a pull-out drawer, a snack from the same order.

Type

Packaging and brand design

Context

University project

Brand

Be Natural (Tabiei Bash in Persian),
fresh juice

Deliverables

Ten concept sketches, final box,
dieline, brand sheets

The brief

Be Natural is the English meaning of the brand's Persian name, Tabiei Bash. I studied the brand, its current two-bottle carrier and its competitors, then set out to design a pack that protects the bottles, is easy to carry and open, and keeps the brand visible.

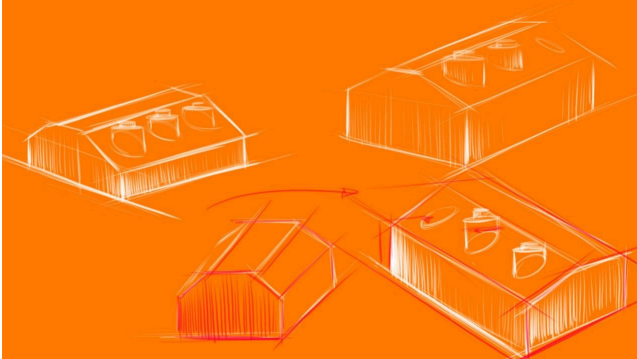

Ten sketches, three finalists

I explored ten concepts, scored them against the brief and shortlisted three: a stretched cube with a recessed grip, a one-piece triangular carrier that folds flat without glue, and a box with a rotating lid.

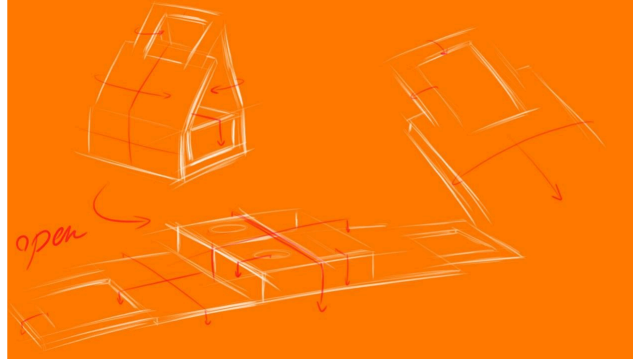

From sketches to the final box

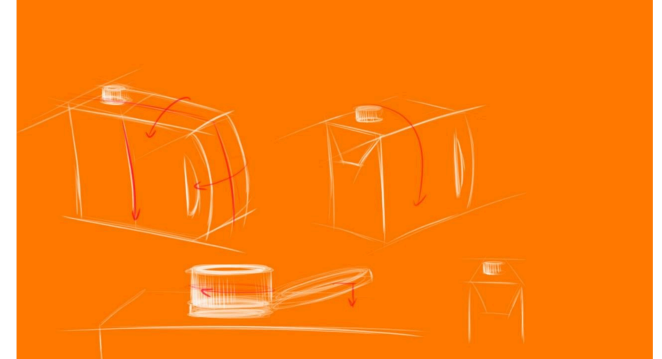

The final box carries the bottles above and a pull-out drawer below, closes under a rope handle, and is cut from a single dieline.

Concept 1: a gable-topped carrier that folds flat.

Finalist: a triangular carrier that opens into a display.

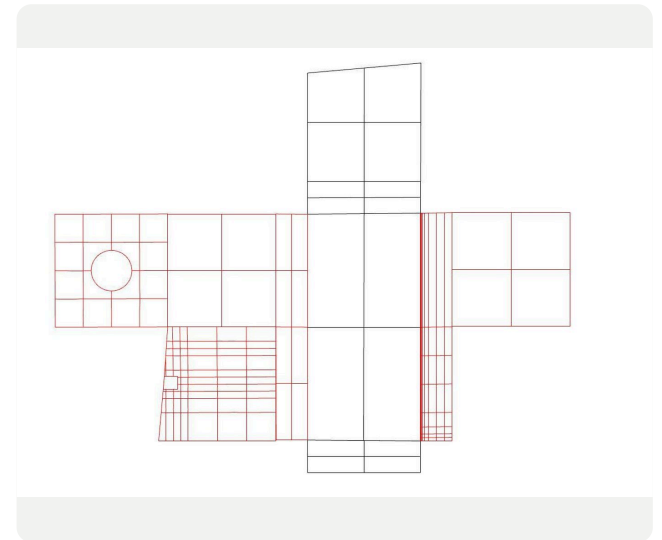

Finalist: arrows map opening and closing.

The drawer slides out for a side order.

Closed, with the rope handle.

Dieline: the box is cut from one sheet.

Furniture design

Cut

Seating for directors, assistants and camera operators that takes its shape from the clapperboard and keeps their tools within reach.

Type

Furniture design

Users

Directors, assistant directors, camera operators

Context

Individual university project

Materials

Brushed black aluminium, recycled charcoal fabric, natural bamboo

The problem

Studio chairs are bulky, there is nowhere to keep a tablet, headphones or the slate, and so the set gets cluttered. Nothing about the furniture speaks the language of film.

The idea

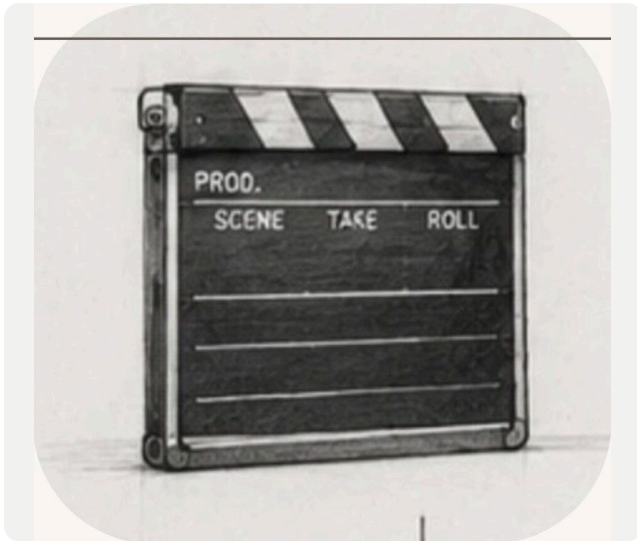

Use the clapperboard as the form, turn the chair into a small workstation with built-in storage, and keep it foldable and made from recyclable materials.

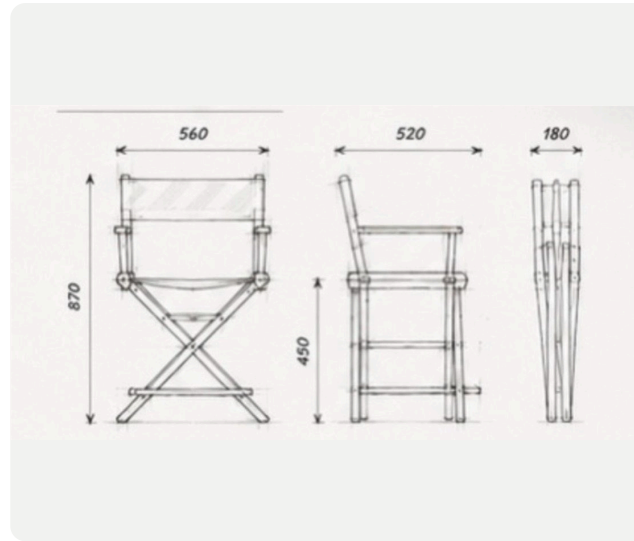

Cut

Two models, one language

Model one is a folding director's chair. Model two keeps the striped panel as an adjustable backrest and adds a pocket for a tablet and headphones.

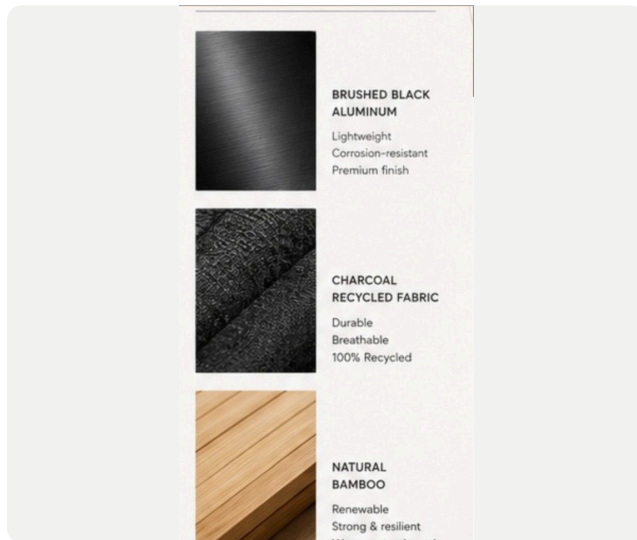

Starting point: the clapperboard.

Model one: 560 × 520 × 870 mm, seat at 450 mm, folds to 180 mm.

Model two: first hand sketch.

Materials: aluminium, recycled fabric, bamboo.

The chair on set.

Model two: backrest panel and tablet pocket.

Product and accessory design

Convex / Concave

A women's shoulder bag whose sides are shaped by convex and concave curves, developed from one silhouette to a full-scale felt prototype.

Type

Product and accessory design

Context

Individual university project

Role

Concept, form development, 3D model, prototype

Tools

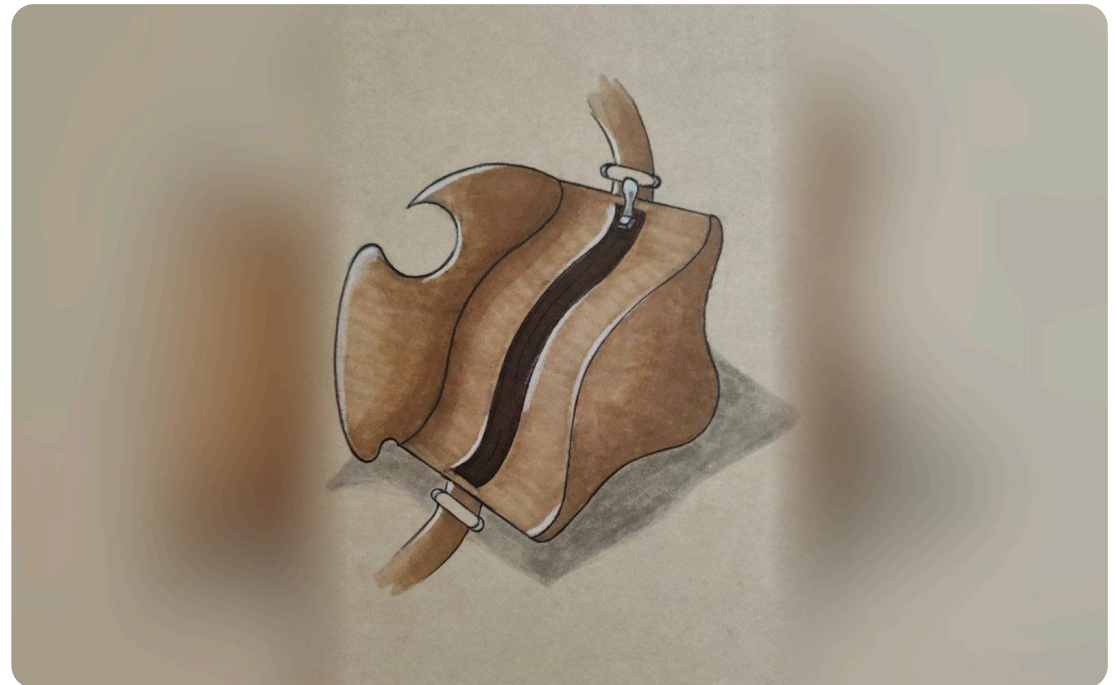

Pencil and markers, 3D modelling, felt, card, zip

The idea

An everyday bag that reads as a small sculpture without giving up comfort: a crescent cut at the top, and a body that swells and tucks in along a single line.

Prototype

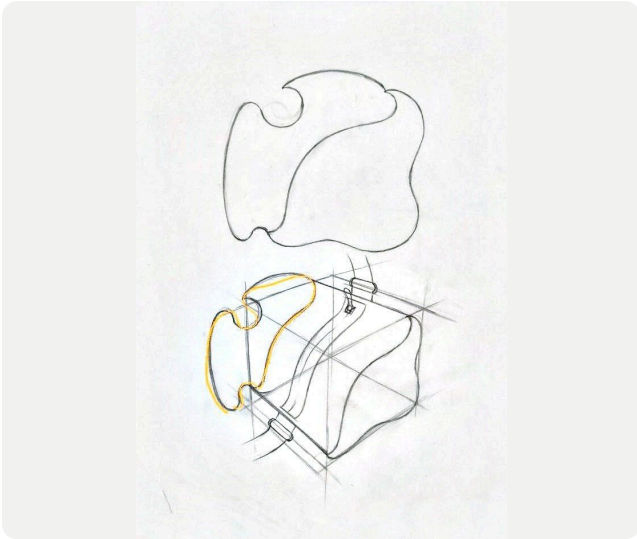

Built at full size in grey felt with hand-stitched edges, card stiffeners and a curved zip, to judge proportions and how the bag opens.

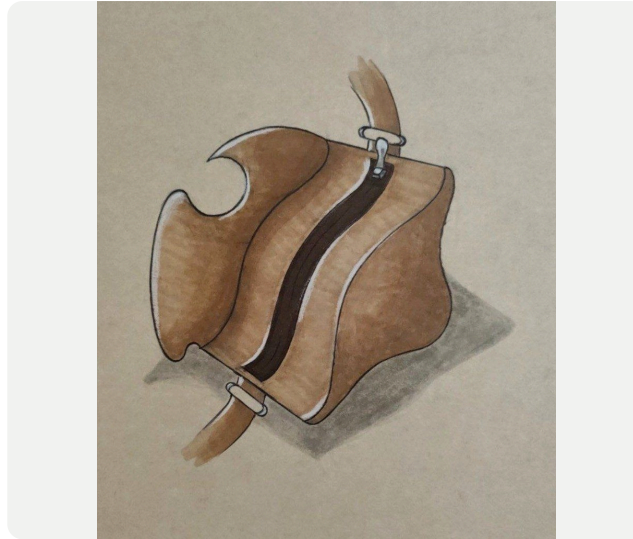

Convex / Concave

From silhouette to felt prototype

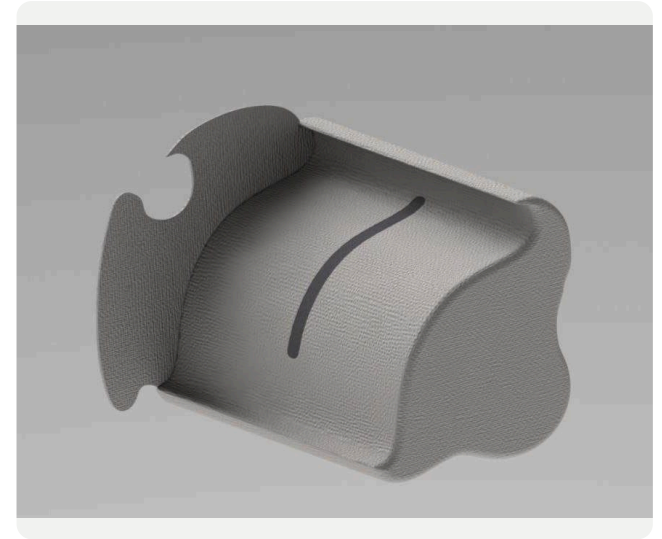

Pencil studies fixed the silhouette, a marker rendering placed the zip, a 3D model checked depth, and the felt prototype tested it at full size.

Silhouette study and perspective.

Marker rendering with the curved zip.

3D model of the open shell.

The zip follows the curved seam.

A stitched line carries the curve.

The two shells overlap and lock.
